

## Preview your content

December 29, 2022 • Jan Cerman • 1 min read

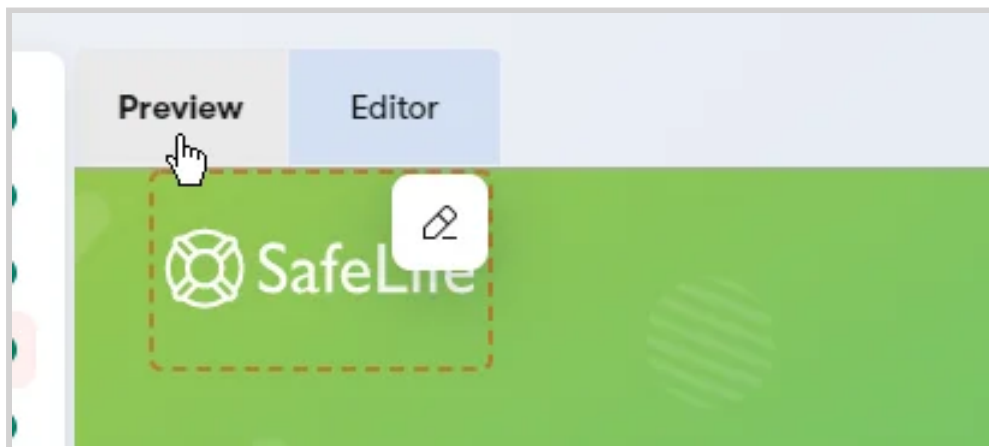

Content preview enables you to preview your latest changes in items before you publish them.

To use preview, your developers first need to [set up preview for your app and project](#). Once this is done, you can preview your work using the preview button in Kontent.ai.

### Preview in Web Spotlight

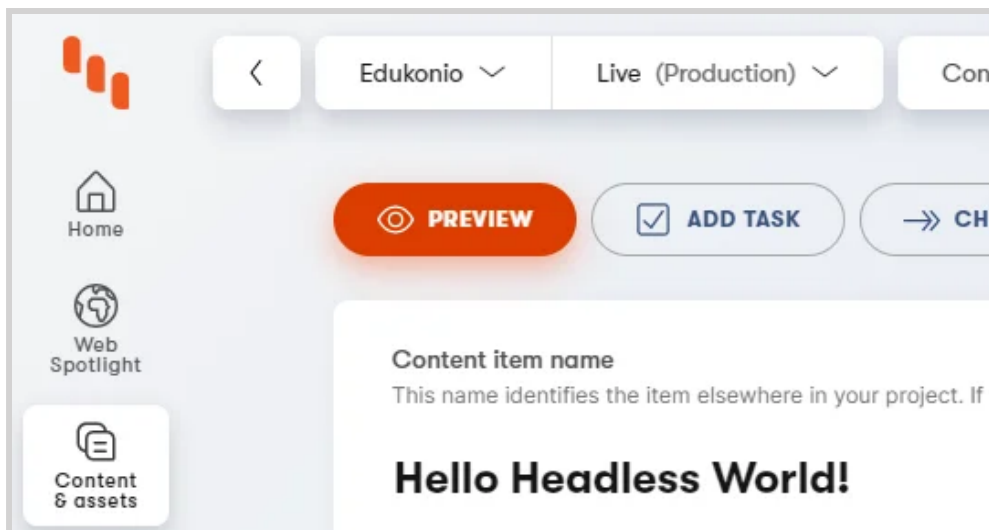

If you're using Web Spotlight, you can see the preview of your content directly in Kontent.ai. Click the **Preview** tab to see it.

To go back to the content item editing, click the  button on the element you want to edit or switch back to the **Editor** tab.

### Preview your latest changes

To preview a [content item](#) you're currently editing outside Web Spotlight, click the  **Preview** button at the top. This opens a new browser tab with a preview of your item.

### Don't see the preview button?

If you don't see the  **Preview** button, you need to contact your project manager or developer. It's likely that they just forgot to [set up the preview URL](#).

## Edit directly from preview

If you spot a mistake when previewing your content, you can go back to editing directly in Kontent.ai by clicking an edit button in the preview. This is something that your developers need to [implement](#) first.

## What's next?

- [Publish your content](#) when you are ready to show it to the world.
- [Schedule an exact publish date](#) to plan your releases ahead.
